1 • Overview

Kunoch Command is a private, multi-agent advisory command center for the Kunoch Family Office. You issue a **directive**; an orchestrator agent named **Fredrick** (Chief of Staff) selects the right specialists from a roster of seven — CFO, Legal Advisor, M&A Strategist, PPP Consultant, Board Advisor, Tech Architect, and Research Intelligence — has each analyse the directive, and then writes a single decisive **executive briefing**.

Every directive is scoped to one of your businesses (or, for portfolio questions, to several at once). Each business's full profile — positioning, stage, priorities, non-negotiables, brand — is injected into every agent so the advice is grounded in that specific business's reality.

The app runs in your browser at kelechidozie-claude.github.io/kunoch-command, installs as an app on phone and desktop, and — once you sign in — syncs everything to your private cloud workspace.

2 • The interface at a glance

Top bar

- › **Active Business** switcher — sets which business the directive is scoped to.
- › **Cost meter** — `RUN` (this interaction) and `MTD` (month-to-date) estimated API spend.

Three tabs

- › **COMMAND** — issue directives and read briefings.
- › **MEETINGS** — ingest transcripts/notes and run weekly reviews.
- › **GUIDE** — quick in-app help and links to these PDFs.

Sidebar

- › **Agent Selection Mode** — AUTO (Fredrick chooses) or MANUAL (you choose).
- › **Agent Roster** — live status of each specialist during a run.
- › **Recent Runs** — your history; click any run to reopen it.
- › **API key panel**, **Export / Import**, and the **SYNC** panel.

3 • First-time setup

The app works immediately in **local mode**: open the API panel (bottom-left), paste your Anthropic key (`sk-ant-...`), and Save. Your data stays on that device.

To sync across devices and enable Meetings and Auto-reviews, complete the three cloud steps below (one-time):

- 1 **Set the server key.** Supabase dashboard → Project Settings → Edge Functions → Secrets → add `ANTHROPIC_API_KEY` = your `sk-ant-...` key. This powers signed-in AI calls and the Monday auto-reviews without the key ever living in the browser.
- 2 **Allow the login redirect.** Authentication → URL Configuration → set **Site URL** and add to **Redirect URLs**: `https://kelechidozie-claude.github.io/kunoch-command/` (also add the `/**` wildcard).
- 3 **Sign in.** Open the live app → sidebar SYNC panel → enter your email → SEND MAGIC LINK → click the link in the email. Repeat on your phone with the **same email** to share one dataset.

RELIABLE EMAIL

The built-in email sender is rate-limited. Connect your own SMTP (Authentication → SMTP settings — e.g. Resend) for fast, reliable magic links, then raise the email rate limit.

4 • Issuing a directive

- 1 Select the **active business** (top-left).
- 2 Optionally drop **documents** for analysis — PDF, Word, Excel, PowerPoint, CSV, text, or images.
- 3 Set **Directive Scope**: Single business, or Cross-business (see §6).
- 4 Set **Agent mode** in the sidebar: AUTO lets Fredrick pick 2–4 specialists; MANUAL lets you tick exactly who runs.
- 5 Type the directive and press **ISSUE** (or ⌘/Ctrl + Enter).

Fredrick reads the directive, briefs each chosen specialist, and the specialists run in parallel. Each **specialist card** shows Fredrick's brief (click to expand) and that agent's analysis. The gold card at the bottom is Fredrick's **executive briefing**: Situation, Key Tensions, Recommendation, and three Next Steps.

Export & copy: use **EXPORT PDF** for a letterhead briefing document, **COPY** on any card, or ↺ **RETRY** to re-run a single agent.

5 • Follow-ups

After a run, the **CONTINUE THE THREAD** box appears under the briefing. Ask a follow-up and Fredrick routes it to *only* the relevant specialist(s), answers building on the prior conclusions (Direct answer · What changes · Next step), and stores the exchange inside that run. Reopen the run later and the whole thread is intact.

6 • Cross-business directives

For portfolio questions that span businesses, set **Directive Scope** to **Cross-business** and tick **two or more** businesses in the chip picker. Fredrick receives all their profiles and briefs the agents on **synergies, conflicts, resource contention, and sequencing** across them.

The briefing is portfolio-level (Portfolio situation · Synergies · Conflicts & contention · Recommendation · Next steps, each tagged to the business it concerns). The run is **filed under every business involved** and badged ♦ **N BIZ** in history.

7 • Businesses & profiles

Use the switcher's + **NEW BUSINESS** or ✎ **EDIT CURRENT**. A rich profile makes every briefing sharper. Fields include positioning, stage, revenue band, business model, target customer, key people, up to three active priorities, non-negotiables/constraints, competitors, and current challenges — plus a **Brand** tab (colours, fonts, tone, values, do's/don'ts) used when the directive touches brand or creative work.

Memory: the last few run summaries for a business are automatically injected into new directives, so advice builds on prior conclusions. The **Scheduled Auto-Review** toggle (see §9) lives at the bottom of the profile.

8 • Meeting intelligence

Open the **MEETINGS** tab (requires sign-in). Choose the provenance — **Own transcript** or **Imported notes** — and drop a file: `.vtt .srt .txt .md .csv`, Word, PDF, Excel, or an image of notes.

On intake, the original is stored securely in your private workspace with a **SHA-256 fingerprint**, timestamp, uploader, and provenance recorded in an append-only audit log. Fredrick then normalises it into a **structured record**: date, platform, attendees, agenda, decisions, action items (owner & due), open questions, and flags. Each meeting card renders the record; **VIEW ORIGINAL** opens the stored source.

Weekly review summarises the last 30 days of meetings, carries forward open action items, and surfaces risks.

VOICE AUDIO

Audio files (mp3/m4a/wav...) are not transcribed yet — that needs a transcription provider (Deepgram or AssemblyAI). Upload a text transcript for now.

9 • Scheduled auto-reviews

Tick **Scheduled Auto-Review** on any business profile. Every **Monday at 07:00 Africa/Lagos**, Kunoch Command automatically generates a weekly portfolio review for that business — built from its profile and the last 30 days of meetings — and files it into the business's run history, ready when you open the app. Requires the server key (§3, step 1).

10 • Cloud sync & multiple devices

Signed in, your businesses, run history, follow-ups, and meetings live in your private cloud workspace and are shared across every device signed in with the same email — protected so only your account can read them. Signed out, the app works fully in local mode on that one device. `localStorage` is always kept as an offline cache, so the app is fast and works without a connection.

11 • Cost meter

The top-bar meter shows **RUN** (the estimated Anthropic spend of your most recent interaction) and **MTD** (month-to-date total). It reads usage directly from each API response and is priced at current rates: Fredrick's model at the orchestrator rate, specialists at the Sonnet rate.

12 • Backup — export & import

Export Data (sidebar) downloads a dated JSON backup of your businesses, active selection, and run history. Your API key is deliberately never included. **Import** restores from a backup file (it replaces local data on that device, and syncs up to the cloud if you're signed in).

13 • Troubleshooting

SYMPTOM	FIX
Magic link opens <code>127.0.0.1</code> / localhost	Send the link from the live site (not a local copy); delete older link emails; confirm the Redirect URLs are saved in Supabase.
"Sign-in rate limit exceeded"	The built-in email sender is throttled. Connect your own SMTP (Resend) and raise the email rate limit; or wait ~30–60 min.
AI call fails when signed in	The <code>ANTHROPIC_API_KEY</code> secret isn't set in Supabase (§3, step 1).
Rate-limited mid-run	The app retries automatically. Wait ~30s and press RETRY on the card, or raise your Anthropic tier.
Meetings tab shows a sign-in gate	Meetings require sign-in — data is stored per account.
History storage full	Use Export Data to back up; older runs then recycle automatically (cap 8 per business locally).

14 • Reference

The specialists

CFO (financial modelling) · Legal Advisor (contracts, IP, multi-jurisdiction) · M&A Strategist (deals, valuation, diligence) · PPP Consultant (government & DFI) · Board Advisor (governance, family office) · Tech Architect (AI, SaaS, infrastructure) · Research Intelligence (market data, competitors).

The businesses

Cirquu · IFTA Farms · Hertunba Fashion · Insight360 · Disrupt DNA · Kunoch Foods · lamloyal Africa · Getabar · D4ULogistics · LID Stores. Add, edit, or remove your own at any time.

Data & security

- › Signed-in data is isolated to your account and never world-readable.
- › The Anthropic key, once set as a server secret, never touches the browser.
- › Meeting originals are fingerprinted (SHA-256) and logged in an append-only, hash-chained audit trail — supporting the family-office governance requirements.
- › Backups never contain your API key.
